mashup

overview

mashup is a delay effect with an internal variable length step sequencer. it allows you to select from six delay types: 0.1, 1, or 10 second delays with or without interpolation. each step allows for specific time and feedback adjustments. you can also adjust the start, end, and sequencer modes. mashup can be hand set to create convoluted delay effects, or used to create very tight decimations. as always the patch randomizer is ready to toss some chaos into your tracks. version 2.0 is not reverse compatible with 1.5, so be careful!
