sideslip

overview

sideslip is a granular pitch shifter effect with an internal variable length step sequencer. it allows you to modify pitch and grain size for each step, as well as edit start, end, and sequencer modes, and granular envelope type for a wide variety of effects. breakdown can be hand set to create gentle rhythmic pitch corrections, or completely destroy a loop or sample by granular deconstruction. feel free to use the patch randomizer for some creative inspiration. version 2.0 is not reverse compatible with 1.5 patches, so be careful when updating.
